Task 2 High-Scoring Sample Response

The article outlines the university's plan to install smart boards in all large lecture halls. These digital boards would replace traditional whiteboards and allow instructors to save and share notes electronically. The university believes this will make lectures more interactive and help students review material after class.

However, the man disagrees with the proposal. First, he says not all professors are comfortable using new technology. He gives an example of a class where the professor struggled just to use basic software. He believes smart boards would only slow things down and make lectures more frustrating. Second, he says that students already get notes and materials online. Most professors upload their slides after class, so saving board notes doesn't add much value.

In summary, the man does not agree with the university's proposal to install smartboards in lecture halls because he thinks it's unnecessary and might actually make classes less efficient.
